        * The location of the DOMPDP font directory
        *
        * The location of the directory where DOMPDP will store fonts and font metrics
        * Note: This directory must exist and be writable by the webserver process.
        * *Please note the trailing slash.*
        *
        * Notes regarding fonts:
        * Additional .afm font metrics can be added by executing load_font.php from command line.
        *
        * Only the original "Base 14 fonts" are present on all pdf viewers. Additional fonts must
        * be embedded in the pdf file or the PDF may not display correctly. This can
        significantly
        * increase file size unless font subsetting is enabled. Before embedding a font please
        * review your rights under the font license.
        *
        * Any font specification in the source HTML is translated to the closest font available
        * in the font directory.
        *
        * The pdf standard "Base 14 fonts" are:
        * Courier, Courier-Bold, Courier-BoldOblique, Courier-Oblique,
        * Helvetica, Helvetica-Bold, Helvetica-BoldOblique, Helvetica-Oblique,
        * Times-Roman, Times-Bold, Times-BoldItalic, Times-Italic,
        * Symbol, ZapfDingbats.

/**
 * The PDF rendering backend to use
 *
 * Valid settings are 'PDFLib', 'CPDF' (the bundled R&OS PDF class), 'GD' and
 * 'auto'. 'auto' will look for PDFLib and use it if found, or if not it will
 * fall back on CPDF. 'GD' renders PDFs to graphic files.
 * {@link * Canvas_Factory} ultimately determines which rendering class to
 * instantiate based on this setting.
 *
 * Both PDFLib & CPDF rendering backends provide sufficient rendering
 * capabilities for dompdf, however additional features (e.g. object,
 * image and font support, etc.) differ between backends. Please see
 * {@link PDFLib_Adapter} for more information on the PDFLib backend
 * and {@link CPDF_Adapter} and lib/class.pdf.php for more information
 * on CPDF. Also see the documentation for each backend at the links
 * below.
 *
 * The GD rendering backend is a little different than PDFLib and
 * CPDF. Several features of CPDF and PDFLib are not supported or do
 * not make any sense when creating image files. For example,
 * multiple pages are not supported, nor are PDF 'objects'. Have a
 * look at {@link GD_Adapter} for more information. GD support is
 * experimental, so use it at your own risk.
 *
 * @link http://www.pdflib.com
 * @link http://www.ros.co.nz/pdf
 * @link http://www.php.net/image
 */

/**
 * Image DPI setting
 *
 * This setting determines the default DPI setting for images and fonts. The
 * DPI may be overridden for inline images by explicitly setting the
 * image's width & height style attributes (i.e. if the image's native
 * width is 600 pixels and you specify the image's width as 72 points,
 * the image will have a DPI of 600 in the rendered PDF. The DPI of
 * background images can not be overridden and is controlled entirely
 * via this parameter.
 *
 * For the purposes of DOMPdF, pixels per inch (PPI) = dots per inch (DPI).
 * If a size in html is given as px (or without unit as image size),
 * this tells the corresponding size in pt.
 * This adjusts the relative sizes to be similar to the rendering of the
 * html page in a reference browser.
 *
 * In pdf, always 1 pt = 1/72 inch
 *
 * Rendering resolution of various browsers in px per inch:
 * Windows Firefox and Internet Explorer:
 *     * SystemControl->Display properties->FontResolution: Default:96, largefonts:120,
custom:?
 * Linux Firefox:
 *     about:config *resolution: Default:96
 *     (xorg screen dimension in mm and Desktop font dpi settings are ignored)

```

```

*
* Take care about extra font/image zoom factor of browser.
*
* In images, <img> size in pixel attribute, img css style, are overriding
* the real image dimension in px for rendering.
*
* @var int
*/
